Abstracts

ISOAMYL P-METHOXYCINNAMATE is a soluble organic UV-B filter. It absorbs UV-B radiation from approximately 280 to 320 nm. The maximum concentration is 10 %. UV filters minimise the undesired effects of UV radiation on the skin and are, therefore, an important component of sunscreens. By protecting the skin against the dangerous sun radiation, they contribute towards preventing premature light-caused skin ageing and skin cancer. In this connection a distinction is made between soluble organic UV filters and those based on mineral and / or organic pigments. Whereas soluble organic UV filters absorb the UV radiation, transform it into heat and form an invisible protection shield in the upper skin layer, UV filters on the basis of pigments reflect, scatter and absorb the sun radiation already on the skin surface. Organic UV filters absorb the energy of the ultraviolet part of the light in the range from approximately 280 to 400 nm. In this connection the energy of the absorbed photon must correspond to the energy which is necessary to elevate the electron in the molecule of the filter substance from a low to a higher orbit. When the electron falls back to its original orbit, the absorbed energy is either given off as heat or as radiation of a longer wavelength and hence rendered harmless. The organic UV filters are distinguished, amongst others, by the position of the absorption area, the photostability, the solubility and the penetration capacity. Depending on the wave range of the ultraviolet radiation which is absorbed by the UV filter, a distinction is made between UV-A, UV-B and broadband filters.
