Abstracts

According to our (Global Info Research) latest study, the global Isobutyl Vinyl Ether market size was valued at US\$ 214 million in 2025 and is forecast to a readjusted size of US\$ 315 million by 2032 with a CAGR of 5.7% during review period.

Isobutyl Vinyl Ether is a colorless, highly reactive vinyl ether monomer (chemical formula: C_4H_8O) used primarily as an intermediate for specialty polymers, copolymers, coatings, adhesives, inks, UV-curable systems, and fine chemical synthesis. It is valued for its rapid cationic polymerization behavior, low glass-transition temperature contribution, flexibility-enhancing properties, and good compatibility with acrylic and epoxy-based formulations. The supply chain begins with upstream petrochemical feedstocks such as ethylene, acetylene (or vinylation intermediates), and isobutanol, which are used to produce vinyl ether compounds through catalytic vinylation reactions. Midstream manufacturers synthesize, purify, stabilize, and package Isobutyl Vinyl Ether according to industrial or electronic-grade specifications, often supplying it in inhibitor-stabilized form to prevent premature polymerization during storage and transportation. Downstream users include producers of pressure-sensitive adhesives, coatings, printing inks, photoresists, UV-curable materials, specialty polymers, sealants, and fine chemicals, while end-user industries include packaging, automotive, electronics, construction, industrial manufacturing, and advanced materials sectors. In 2025, global Isobutyl Vinyl Ether output was about 70,000 tons with 90,000 tons of capacity, average prices of USD 2,500-6,000 per ton, and gross margins around 30%.
