According to our (Global Info Research) latest study, the global Isolated Modulator market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

An isolated modulator is a delta-sigma modulator that converts an analog input signal into a high-speed digital bit stream consisting of zeros and ones, while using an isolation layer to separate the input and output circuits. The isolation layer is highly resistant to electromagnetic interference, often called EMI, which is generated by external sources and can negatively affect the circuit.
