The isolated transformer uses the electrical insulation between the primary and secondary winding coils of the transformer, and is a transformer with the function of isolating the distributed system. Isolation refers to the electrical insulation between the primary and secondary winding coils of the transformer. The main function of the isolation transformer is to completely insulate the primary side and the secondary side, and also isolate the circuit. In addition, the characteristics of high frequency loss of its iron Bi are used to suppress the high-frequency clutter from entering the control circuit.
