Abstracts

The global Isoprinosine FDF market size is expected to reach \$ 307.7 million by 2029, rising at a market growth of 3.6% CAGR during the forecast period (2023-2029).

Market driver for the Isoprinosine is its well-established history as an antiviral and immunomodulatory drug. Isoprinosine's efficacy in treating various viral infections, such as herpes simplex and viral hepatitis, has made it a preferred choice for healthcare providers and patients seeking effective antiviral treatments. Its immunomodulatory properties, which enhance the body's immune response, have also contributed to its popularity. Moreover, in times of emerging viral threats, such as the COVID-19 pandemic, Isoprinosine gained attention as a potential treatment option, further boosting its market demand. As research continues to explore its applications in other immune-related conditions, Isoprinosine's market presence is likely to expand.

Isoprinosine is an antiviral drug that is a combination of inosine and dimepranol acedoben (a salt of acetamidobenzoic acid and dimethylaminoisopropanol) in a ratio of 1 to 3. It is used for its immunomodulatory properties and is believed to enhance the body's immune response. Isoprinosine is used in the treatment of various viral infections and immune-related disorders, although its exact mechanisms of action are not fully understood
