According to our (Global Info Research) latest study, the global Isothermal Forgings market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Isothermal forging refers to the process of forging a blank into a precision forged part in a die at a constant temperature. Compared with conventional forging, isothermal forging can control the heating temperature of the blank within a certain range, making the temperature during the forging process roughly equal, which greatly improves the plastic change of the die caused by sudden temperature changes during the processing. Due to the process characteristics of isothermal forging, it is particularly suitable for precision forging of materials that are very sensitive to deformation temperature or difficult to form materials, such as magnesium alloys, aluminum alloys, etc.
