According to our (Global Info Research) latest study, the global ITOF Camera market size was valued at US$ million in 2025 and is forecast to a readjusted size of US$ million by 2032 with a CAGR of %during review period.

iTOF camera, full name is indirect Time-of-Flight camera, is a technical device that uses the principle of time-of-flight (ToF) of light for three-dimensional imaging. Specifically, the iTOF camera transmits a modulated infrared light signal into the scene, and then the sensor receives the light signal reflected back by the object to be measured in the scene, and calculates the phase difference between the transmitted signal and the received signal based on the accumulated charge during the exposure (integration) time, thereby indirectly obtaining the depth information of the target object.

As an important part of 3D visual perception technology, the iToF (indirect time of flight) camera market has also shown a booming development trend in recent years with the rapid development of artificial intelligence, Internet of Things (AIoT) and smart manufacturing. As one of the mainstream 3D visual perception technologies, iToF technology has been widely used in consumer electronics such as mobile phones, tablets, sweeping robots, as well as emerging AIoT fields such as 3D scanning, smart transportation, smart agriculture and animal husbandry, security identification, and somatosensory fitness. With the rapid development of the AIoT industry, customers' demand for 3D visual perception technology has increased significantly, especially in small batches, differentiated, and diversified application scenarios. iToF cameras have been widely welcomed by the market for their high performance, high precision, and low cost. In the fields of smart manufacturing, autonomous driving, robot navigation, etc., iToF cameras are also playing an increasingly important role, and market demand continues to grow. In summary, the iToF camera market is in a rapid development
