## Abstracts

The global IVD Magnetic Beads market size is expected to reach \$ 1286 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

In 2025, global IVD Magnetic Beads Production Catalyst Production Catalyst Production production reached approximately 4,470L with an average global market price of around US\$200 per ml. Single-line annual production capacity averages 200 L with a gross margin of approximately 50-53.9%. The IVD magnetic beads industry chain primarily consists of upstream high-precision microsphere raw materials (e.g., polystyrene, silica) and functional modification materials (such as carboxyl and amino groups), with key technological barriers concentrated in surface modification and particle size uniformity control. Downstream applications are dominated by chemiluminescence (approximately 35%), nucleic acid extraction (around 30%), and immunoassays (about 20%), while cell separation, biomacromolecule purification, molecular biology, and others account for the remaining 15%. Demand growth is driven by the widespread adoption of chemiluminescence diagnostics, advancements in precision medicine technologies, and the penetration of automated equipment, leading to increasingly stringent requirements for magnetic beads with high consistency and low nonspecific adsorption. Current commercial opportunities lie in the domestic substitution of high-end magnetic microspheres upstream, the development of multifunctional magnetic beads for multiplex detection, and customized separation and purification solutions tailored for molecular diagnostics and cell therapy applications.

IVD Magnetic Beads are engineered magnetic particles specifically designed to meet the stringent requirements of in vitro diagnostic (IVD) assays, where they serve as solid-phase carriers for the capture, separation, and purification of target analytes such as proteins, nucleic acids, or cells from complex biological samples. Their surface is

functionalized with specific capture molecules (e.g., antibodies, oligonucleotides) that enable highly selective binding to the target, while their superparamagnetic or paramagnetic properties allow for rapid and efficient magnetic separation under an external magnetic field, facilitating the removal of interfering substances and the concentration of the target. This design significantly enhances assay sensitivity and specificity, reduces manual handling steps, and improves workflow reproducibility, making them compatible with automated high-throughput diagnostic platforms. Additionally, the beads are optimized for stability, lot-to-lot consistency, and low nonspecific binding to ensure reliable and reproducible diagnostic results in clinical settings.

The development trend of IVD magnetic beads may include the following aspects:

**Product performance improvement:** With the development of biomedical technology, the performance requirements for IVD magnetic beads will become increasingly higher. For example, magnetic beads are required to have higher coating density, stronger chemiluminescence efficiency and lower non-specific adsorption, etc.

**New preparation methods and technologies:** In the future, with the continuous development of new materials and new technologies, new preparation methods and technologies may emerge to further improve the performance of IVD magnetic beads and reduce costs.

**Expansion of application fields:** Currently, IVD magnetic beads have been widely used in immunoassays, cell separation, purification of biological macromolecules, and molecular biology. In the future, as technology advances and people's understanding of it deepens, IVD magnetic beads may be used in more fields.

**Environmental friendliness:** With the improvement of environmental awareness, the environmental requirements for IVD magnetic beads will also become higher and higher. Therefore, the development of environmentally friendly IVD magnetic beads will become an important trend in the future.

**Development of biofunctional magnetic beads:** With the development of nanotechnology and progress in biomedicine, biofunctional magnetic beads will be more widely used. For example, after the epidemic, domestic magnetic bead technology companies are developing collaboratively, developing the technology in the direction of functional, chemiluminescence, cell therapy and other applications. In general, the future development of IVD magnetic beads will develop in the direction of high performance, low cost, wide application and environmental protection. At the same time, the development of nano magnetic beads will also promote the technological progress and performance improvement of IVD magnetic beads.
