Jacketed ball valves are a type of ball valves with a special structure, featuring a jacket wrapped around the outer layer of the valve body, which is used to heat or cool the media inside the valve body. Jacketed ball valves are typically used in situations where temperature control of the media or prevention of media crystallization and solidification is required. By injecting media such as steam, hot water, or cooling water into the jacket, the temperature of the media inside the valve body can be regulated. Jacketed ball valves are characterized by their compact structure, flexible operation, and reliable sealing, and are widely used in low-temperature or high-temperature media control systems in industries such as petroleum, chemicals, and pharmaceuticals.
