Abstracts

According to our (Global Info Research) latest study, the global Joint Reconstruction market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Joint reconstruction involves rebuilding the architecture of a joint to restore its proper function and to reduce a patient's pain. Some forms of joint reconstruction include total hip replacement, total knee replacement, ACL (anterior cruciate ligament) reconstruction, and chondroplasty.

In total hip replacement, physicians replace the damaged bone and cartilage with prosthetic components. They remove the damaged femoral head and place a metal stem into the hollow center of the femur. They then use a metal or ceramic ball to replace the femoral head. They replace the damaged cartilage lining the acetabulum with a metal socket, holding it in place with screws or cement. Surgeons then place a plastic, ceramic, or metal spacer between the prosthetic ball-and-socket surfaces to provide a smoothly gliding surface. Total knee replacement involves resurfacing the bones. Physicians replace the damaged cartilage at the ends of the femur and the tibia, as well as a small amount of underlying bone, with metal components that re-create the surface of the bone. In some cases, they resurface the underside of the patella with a plastic disk. They insert a plastic spacer between the metal pieces to create a smoother surface.
