Abstracts

The global Kaplan Turbine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A Kaplan Turbine is a type of water turbine primarily used for hydroelectric power generation in hydroelectric power plants. It was designed and developed by Austrian engineer Victor Kaplan in the early 20th century.

Kaplan turbines are designed with adjustable blades and have the following features:

Adjustable blades: The blades of the Kaplan turbine can be adjusted to control the output power of the turbine according to the change of water flow and head. This adjustable blade design makes Kaplan turbines adaptable and able to operate efficiently under varying hydraulic conditions.

High efficiency: Kaplan turbines are characterized by high efficiency, which can convert the kinetic energy of water flow into mechanical energy and electrical energy. By adjusting the angle of the blades, the water flow can form a proper flow in the turbine, and the kinetic energy of the water flow can be utilized to the maximum extent.

Wide operating range: Kaplan turbines are suitable for a wide range of head and flow conditions. Adjusting the blade angle can adapt to the operation under different water heads, so that the Kaplan turbine can work efficiently under both low water head and high water head conditions.

Adaptable: Kaplan turbines are suitable for a variety of hydro resources, including rivers, dams, lakes and reservoirs. It can be used flexibly in different hydroelectric sites

and adjusted and optimized according to requirements.

High reliability: Kaplan turbine has the characteristics of high reliability. After years of development and improvement, it has become a type of turbine widely used in the field of hydroelectric power generation. It has simple structure, stable operation and requires less maintenance.

All in all, the Kaplan turbine is a commonly used turbine in hydroelectric power generation, through the design of adjustable blades, it can adapt to the high-efficiency operation under different water head and water flow conditions. It has the advantages of high efficiency, wide range of working conditions, strong adaptability and high reliability, and is widely used in hydropower plants and water conservancy projects.
