Kettle reboiler is a common heat exchange equipment, mainly used for evaporation and liquid heating in chemical and petrochemical processes. Its design feature is to use the heating medium (such as steam) to pass through the tube bundle, and partially evaporate the liquid in the kettle through heat transfer. The generated steam is sent back to the process flow, and the unevaporated liquid is usually discharged in the liquid phase. Kettle reboiler is widely used in distillation towers and evaporation systems because of its simple operation, high heat exchange efficiency and strong adaptability.
