According to our (Global Info Research) latest study, the global Key Management market size was valued at USD 602.7 million in 2023 and is forecast to a readjusted size of USD 2109.5 million by 2030 with a CAGR of 19.6% during review period.

Key management is the process of administering or managing cryptographic keys for a cryptosystem. It involves the generation, creation, protection, storage, exchange, replacement and use of said keys and with another type of security system built into large cryptosystems, enables selective restriction for certain keys.

Key management concerns keys at the user level, either between users or systems. This is in contrast to key scheduling, which typically refers to the internal handling of keys within the operation of a cipher. Successful key management is critical to the security of a cryptosystem. It is the more challenging side of cryptography in a sense that it involves aspects of social engineering such as system policy, user training, organizational and departmental interactions, and coordination between all of these elements, in contrast to pure mathematical practices that can be automated.
