Abstracts

According to our (Global Info Research) latest study, the global KOH Impregnated Activated Carbon market size was valued at US\$ 82.62 million in 2025 and is forecast to a readjusted size of US\$ 106 million by 2032 with a CAGR of 3.6% during review period.

KOH Impregnated Activated Carbon is a chemisorbent material produced by uniformly loading potassium hydroxide onto the pores and surfaces of finished granular or pelletized activated carbon through processes such as spraying, soaking, drying, and curing. By leveraging the physical adsorption capacity of the activated carbon and the strong alkalinity of the potassium hydroxide, the product selectively removes hydrogen sulfide, sulfur dioxide, hydrogen chloride, and certain malodorous sulfur-containing gases; it is primarily used for gas-phase purification.

Upstream inputs mainly include base carbons—such as coal-based pelletized activated carbon, coal-based granular activated carbon, and coconut shell granular activated carbon—along with industrial-grade potassium hydroxide, deionized water, and small amounts of wetting agents. The base carbon's pore volume, pore size distribution, strength, ash content, and carbon tetrachloride adsorption rate determine the impregnant loading capacity and gas mass transfer efficiency, while the purity and loading uniformity of the potassium hydroxide directly affect the reaction capacity for acidic gases. Downstream applications primarily involve fixed-bed adsorption towers, deodorization units, biogas purification systems, and industrial air filters; the material is typically replaced based on breakthrough concentration or pressure drop.

Global sales volume in 2025 is approximately 23,000 metric tons, with an average

market price of around US\$3,200–3,500 per ton and gross profit margins of approximately 25%–35% for major manufacturers.
