Abstracts

The global KrF Photoresist Monomer market size is expected to reach \$ 173.2 million by 2030, rising at a market growth of 7.3% CAGR during the forecast period (2024-2030).

According to the SEMI report, the semiconductor materials market will grow by 8.6% in 2022, hitting a new high of US\$69.8 billion in market size. Since semiconductor materials are an industry with high technical barriers, most high-end products of semiconductor materials are currently concentrated in the United States, Japan, Germany and other countries and regions. From a demand perspective, Taiwan, China, South Korea, Japan, and the United States are the world's largest semiconductor material markets, accounting for more than 80% of the global market. With the shift of the semiconductor industry, the global semiconductor materials industry has also experienced a shift of center of gravity from west to east. China's semiconductor materials market is the fastest growing region in the world. In 2022, the United States will introduce new regulations to sanction China's advanced semiconductor process industry. This will have a certain impact on all aspects of China's integrated circuit manufacturing industry in the short term. However, in the long term, China's integrated circuit industry will inevitably will embark on the road of independent innovation.

KrF photoresist monomer is the basic raw material used to prepare KrF photoresist. The main component is styrene monomer. The molecular structure of this monomer contains groups that can absorb KrF laser, so it can react with KrF laser to form a polymer, thereby forming the structure of the photoresist.

This report studies the global KrF Photoresist Monomer production, demand, key manufacturers, and key regions.
