KVM is an acronym for Keyboard, Video, and Mouse. The official name of KVM switch is multi-computer switch or KVM SWITCH. Simply put, a KVM switch allows system administrators to control the computer peripherals of multiple servers or computer hosts through a set of keyboards, monitors, and mice. This means that only one person can interact with all the computers, and of course only one at a time. In addition to saving the overhead of multiple keyboards and monitors, a switcher can free up more desk space. KVM switches are usually used in networks and other server sites with multiple computers. In these cases, there are usually multiple computers but only one administrator or network administrator.
