Abstracts

The global L-(+)-Ergothioneine market size is expected to reach \$ 407 million by 2032, rising at a market growth of 26.5% CAGR during the forecast period (2026-2032).

L-(+)-Ergothioneine is a naturally occurring amino acid and is a thiourea derivative of histidine, containing a sulfur atom on the imidazole ring. This compound is made in relatively few organisms, notably Actinobacteria, Cyanobacteria, and certain fungi.

L-(+)-Ergothioneine is a rare natural chiral amino acid with unique cell physiological protection functions such as scavenging free radicals, detoxification, maintaining DNA biosynthesis, normal cell growth, cell immunity, radiation resistance, whitening and anti-aging. Ergothioneine has broad application prospects in the food, cosmetics, functional food and biomedicine industries. In 2025, global L-(+)-Ergothioneine sales reached approximately 3,271.4 Kg, with an average price of 23.4 US\$/g.

The market for L-(+)-Ergothioneine is driven by increasing consumer demand for natural, science-backed antioxidants that support healthy aging, immune function, and cellular protection. As research continues to highlight EGT's unique properties?such as its selective accumulation in high-stress tissues and its role in reducing oxidative damage and inflammation?it is gaining traction in the nutraceutical, cosmetic, and pharmaceutical industries. The rise in chronic diseases linked to oxidative stress, along with a growing preference for clean-label and plant-derived ingredients, further accelerates market growth. Additionally, advances in fermentation and biosynthesis technologies have improved the scalability and cost-effectiveness of EGT production, supporting broader commercial adoption.

This report studies the global L-(+)-Ergothioneine production, demand, key manufacturers, and key regions.
