Abstracts

The global L4 RoboVan market size is expected to reach \$ 1308 million by 2032, rising at a market growth of 34.2% CAGR during the forecast period (2026-2032).

L4 Robovan refers to a driverless logistics vehicle equipped with Level 4 autonomous driving technology, specifically designed for cargo transportation and delivery. This vehicle can autonomously navigate, plan routes, avoid obstacles, and follow traffic rules within a limited geographical area or specific operating scenario without human intervention. RoboVan utilizes multi-sensor fusion (LiDAR, cameras, radar, etc.), high-precision positioning, and an onboard intelligent decision-making system to complete point-to-point cargo transportation, regional delivery, or internal handling tasks within logistics parks. Level 4 autonomous driving capabilities ensure safe and stable driverless operation within its designed operating domain. Typical application scenarios include: last-mile delivery in cities or industrial parks, internal logistics transportation in factories or warehouses, and unmanned delivery in communities or commercial districts. L4 Autonomous Delivery Vehicle primarily targets B2B and B2C logistics service scenarios, reducing the pressure on manual delivery, improving transportation efficiency, and lowering operating costs.

In 2025, global shipments of L4 Robovan are projected to reach approximately 30,000 units, with an average price of \$2,788.73-\$7,014.08 per vehicle and a gross profit margin of approximately 30%-50%. Downstream customers include major express delivery companies such as ZTO Express, YTO Express, STO Express, Yunda Express, and J&T Express. Regarding its business model, NineSenses Intelligent adopts a 'low-price hardware + subscription service' approach. It attracts customers with highly competitive hardware prices and pioneered a 'pay-as-you-go' monthly subscription service for FSD, priced as low as approximately \$250 per month. While

generating continuous revenue through driving service fees, this significantly lowers the barrier to entry and operating costs for users, effectively expanding its user base.

The RoboVan market is in a period of rapid growth. The continued rise in global e-commerce penetration, increasing labor costs, and growing demand from enterprises for more efficient delivery models are driving the industry from technology verification to large-scale commercial deployment. The continuously improving policy environment and the active promotion of autonomous driving regulations and open testing road rights by various countries also provide institutional guarantees for the application of RoboVan. At the core technology level, the continuous decline in sensor costs and the maturity of intelligent perception and path planning algorithms make RoboVan's overall solution increasingly economical and feasible. Current typical application scenarios include urban 'last mile' delivery and logistics within specialized industrial parks, where its efficiency and cost-reduction effects are increasingly recognized by large logistics companies and e-commerce platforms. Despite its huge market potential, the RoboVan industry still faces multiple challenges. First, differences remain in regulations, right-of-way permits, data security, and liability allocation across different countries and regions, increasing policy risks for cross-regional deployment. Meanwhile, technological reliability and safety remain key bottlenecks, especially given the high demands on perception and decision-making systems in complex and dynamic traffic environments. Regarding costs, although hardware prices have decreased, the initial investment threshold remains high for small and medium-sized logistics companies. Furthermore, fragmented market competition and the lack of a fully unified standards system hinder supply chain integration and large-scale deployment. Downstream demand for RoboVan is showing a diversified trend. In urban delivery, the demand for 'last-mile' unmanned vehicles from e-commerce platforms and instant logistics services continues to grow, driving the rapid deployment of low-speed delivery vehicles and miniature freight robots. In industrial parks and warehousing centers, companies are focusing on autonomous logistics vehicles with high load capacity and strong all-weather dispatch capabilities to improve internal logistics automation. In intercity and medium-to-long-distance transportation, the commercial pilot program for autonomous trunk logistics trucks is accelerating, laying the foundation for large-scale replacement of traditional truck transportation in the future. With the development of technologies such as artificial intelligence, cloud-based dispatching systems, and 5G vehicle-to-everything (V2X) connectivity, RoboVan will play a role in a broader transportation network, not only improving operational efficiency but also redefining the global supply chain operation model.
