Abstracts

Lab-on-chips is an assimilated miniaturized device used to perform laboratory processes on a single micro-process chip at a small scale. The chip is usually only millimeters to a few square centimeters in size to achieve automation and high-throughput screening. These chips can handle extremely small fluid volumes, as low as pico liters. The global lab-on-chips application market is driven by rise in adoption of personalized medicine, increase in drug discovery and life science research, and the need for high speed diagnostics. However, the limited technological knowledge and availability of alternative technologies may restraint this market growth. Moreover, the increase in R&D investments in developing economies is expected to provide lucrative opportunities for key market players.
