According to our (Global Info Research) latest study, the global Laboratory Microbial Filtration System market size was valued at USD 381.7 million in 2023 and is forecast to a readjusted size of USD 560.7 million by 2030 with a CAGR of 5.6% during review period.

The microbial filtration system is used for microbial inspection or other solution filtration. It mainly consists of a filtration device (filter bracket, filter cup) combined with an external vacuum pump. When this system is in use, the filter membrane is placed on the filter head and fixed and sealed with the filter cup to form a complete filtration device. Based on the principle of membrane filtration, the sample solution is separated from microorganisms (or required particulate matter), and the microorganisms or particulate matter are retained on the filter membrane and transferred to the filter membrane.
