In today's era of competition for scientific and technological strength, the global demand for scientific instruments continues to grow. According to statistics, the global laboratory analysis and life science instrument market will exceed US\$69 billion in 2021. Driven by the rapid development of global science and technology, the global scientific instrument industry market size will continue to grow. It is expected that the global laboratory analysis and life science instrument market size will increase to US\$102 billion by 2026, with a compound growth rate of 6.9% from 2021 to 2026. . As China, the United States, Japan, European countries and other major countries increase their investment in scientific and technological research and development, the market size of the global scientific instrument industry is expected to continue to grow.

The microbial filtration system is used for microbial inspection or other solution filtration. It mainly consists of a filtration device (filter bracket, filter cup) combined with an external vacuum pump. When this system is in use, the filter membrane is placed on the filter head and fixed and sealed with the filter cup to form a complete filtration device. Based on the principle of membrane filtration, the sample solution is separated from microorganisms (or required particulate matter), and the microorganisms or particulate matter are retained on the filter membrane and transferred to the filter membrane.
