Laminar airflow device is a clean environment equipment that forms unidirectional, stable, low-turbulence airflow through high-efficiency filters (HEPA/ULPA). Its airflow speed is uniform (usually 0.3-0.5m/s), which can effectively control particulate and microbial contamination. It is widely used in scenes such as pharmaceutical sterile production, laboratories, electronic manufacturing and operating rooms. It is divided into vertical laminar flow and horizontal laminar flow. The core indicators include cleanliness (ISO 5 or higher), noise and energy consumption.
