According to our (Global Info Research) latest study, the global Land-bottom Seismograph market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The basic structure of the seismograph consists of a heavy hammer, a recording device and a spring. The seismograph is an instrument that can detect the ground motion, detect the occurrence of earthquake, map the seismic wave form, and output the seismic wave map. When an earthquake occurs, in addition to the physical perception of vibration, if we want to understand the specific vibration mode, direction and period of seismic waves through science, we must use seismograph to record seismic waves. The seismograph used on land is called land-bottom seismograph.
