## Abstracts

The global Land-bottom Seismograph market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The basic structure of the seismograph consists of a heavy hammer, a recording device and a spring. The seismograph is an instrument that can detect the ground motion, detect the occurrence of earthquake, map the seismic wave form, and output the seismic wave map. When an earthquake occurs, in addition to the physical perception of vibration, if we want to understand the specific vibration mode, direction and period of seismic waves through science, we must use seismograph to record seismic waves. The seismograph used on land is called land-bottom seismograph.

This report studies the global Land-bottom Seismograph production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Land-bottom Seismograph, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
