The global Laparoscopic Surgery Simulation Training System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The laparoscopic surgery simulation training system is a surgical simulation training system designed to improve the professional skills of practitioners in the field of medical rehabilitation. The system performs three-dimensional reconstruction of human organs and lesion models based on real human body data, and realizes surgical operation process simulation and skill training based on corresponding pathological requirements, surgical procedure specifications, and established surgical plans.

The composition of the laparoscopic surgery simulation training system includes: an operation console; Abdominal surgery simulation training software (built-in real-time interaction and soft tissue deformation algorithm); Medical model of human abdominal cavity; Computer tactile feedback device; Graphics computer; Immersive experiential interaction system. It is a surgical training platform developed based on the key functions and technical difficulties of the virtual surgical training system, utilizing computer simulation technology and high-tech means such as computer vision, hearing, and tactile perception, for teaching and practical training in the medical field. The system has strong realism and high technological content, and is a risk-free, economical and practical surgical simulation teaching and training system.
