According to our (Global Info Research) latest study, the global Large AI Models for Robots market size was valued at US\$ 26790 million in 2025 and is forecast to a readjusted size of US\$ 105055 million by 2032 with a CAGR of 21.5% during review period.

Large AI models for robotics refer to a class of general-purpose artificial intelligence models designed to drive physical robotic systems. By integrating multimodal data, these models establish generalizable "embodied intelligent decision-making capabilities," enabling robots to perform integrated tasks?encompassing perception, understanding, planning, and action?within complex, real-world environments. Unlike traditional robotics systems reliant on rule-based programming and single-task control, these large AI models?centered on architectures such as Transformers, Vision-Language-Action (VLA) models, or world models?are trained on massive datasets. This training endows robots with cross-scenario adaptability and autonomous decision-making skills, facilitating a transition from industrial automation robots to "general-purpose robots" capable of operating across diverse physical environments, including manufacturing, logistics, healthcare, home services, and specialized operations.

Large AI models for robotics are currently transitioning from the "technology validation phase" to a period of "commercial explosion." Key drivers include labor shortages, the automation upgrade of the manufacturing sector, and the extension of AI capabilities from the digital realm into the physical world. As technologies related to embodied intelligence and world models mature, robots will evolve from single-task executors into "physical AI agents" possessing general-purpose capabilities. The industry is projected to enter a cycle of rapid expansion between 2026 and 2035, with applications gradually

extending from industrial and warehousing settings to home services, medical care, operations in hazardous environments, and national defense. In the long term, this sector could reshape the structure of global production functions, establishing a "robot workforce" as a major productivity infrastructure?following cloud computing and AI?and driving industrial restructuring valued in the trillions of dollars.
