Abstracts

The global Large Area Surface Pollution Meter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A large area surface pollution meter is a device used to measure the level of surface pollution in a given area. Its working principle is to use detectors to measure the radiation level emitted by contaminated surfaces. This device is typically used in nuclear power plants, laboratories, and other facilities for handling and storing radioactive materials. The large area surface pollution measurement instrument consists of a detector, a display unit, and a probe. Detectors are usually Geiger Muller tubes or scintillation detectors, which are sensitive to the radiation emitted from contaminated surfaces. The display unit displays the radiation level detected by the detector, usually measured in counts per minute (CPM) or microsieverts per hour (? Sv/h). The probe is used to locate the detector on a contaminated surface, allowing users to measure the degree of contamination in a specific area.
