Abstracts

According to our (Global Info Research) latest study, the global Large Drop Test Machine market size was valued at US\$ 105 million in 2025 and is forecast to a readjusted size of US\$ 138 million by 2032 with a CAGR of 3.2% during review period.

In 2025, the global production of large drop testing machines reached 20,366 units, with an average selling price of US\$5,000 per unit. The global annual production capacity of large drop testing machines is approximately 35,000 units, with a gross profit margin of approximately 21.8%. A large drop testing machine is a testing device used to simulate drops that may occur to large, heavy products or packaging during handling, loading, unloading, and transportation. Compared to ordinary drop testing machines, it has a greater load-bearing capacity and a greater drop height, enabling a more realistic simulation of drop impacts in real-world application scenarios. The upstream of the large drop testing machine industry chain includes high-strength steel, linear guides/sliders, servo motors, etc.; the midstream consists of large drop testing machine manufacturers; and the downstream mainly includes industries such as packaging, scientific research, and transportation.

The large drop testing machine market remains active, with demand leaning towards 'high-end and customized' products. As the requirements for product reliability and transportation safety verification increase in sectors such as 3C electronics, home appliances, lithium batteries and new energy equipment, and rail/aerospace, drop testing is shifting from traditional single-test verification to a greater emphasis on standard compliance (e.g., multi-angle/multi-height/heavy object drops), reproducible impact waveforms, fixture and tooling compatibility, and data acquisition and traceability capabilities. Simultaneously, large equipment demands higher requirements for

structural rigidity, control precision, safety protection, and operational stability, making manufacturers with engineering design capabilities, modification and delivery capabilities, and after-sales service systems more sought after. Competition is now based on performance and solution capabilities, and future growth is expected to come from the improvement of testing systems in new energy and high-end manufacturing, as well as testing service outsourcing and the expansion of third-party laboratories.
