The global Large Earth Moving Machinery market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

With the development of society and the progress of technology, the future development direction of earth-moving machinery will be to develop earth-moving machinery that can be used for special construction, such as underwater resource development, plateau area construction and frozen soil zone operations; further introduction and improvement of hydraulic technology , such as high energy-saving hydraulic systems; research on new principles of cutting and excavation, such as vibration excavation and flame jet excavation; application of automatic control, remote control and computer control technology, and research on comprehensive mechanized equipment for the entire earthwork construction process.

Earthmoving machinery is machinery that excavates, shovels, pushes or smoothes soil, sand and gravel. It is widely used in construction, water conservancy construction, road construction, airport construction, mining, dock construction, farmland improvement and other projects. The earliest earthmoving machinery was powered by human or animal power. The emergence of steam engines in the 18th century led to the advent of various earthmoving machines. Later, power developed from steam engines to gasoline engines and diesel engines. The structure was gradually improved and the performance was improved day by day.
