Abstracts

In the injection moulding process, the hydraulic cylinder pushes the screw forward and injects the molten plastic resin into the mould cavity with extremely high pressure. As such pressure exceeds 20,000 PSI during the injection process, the two halves of the mould are pushed apart. Large injection moulding machinery is rated according to the “clamping force” of the tonnage. The tonnage is the force used to clamp the two halves of the mould together. The greater the surface area of the moulded component, the more tonnage required. Usually, “large tonnage” machines are machines with a rated clamping force of 500 tonnes or more.
