## Abstracts

According to our latest research, the global Large-Scale Vector Indexing System market size will reach USD 6502 million in 2031, growing at a CAGR of 22.8% over the analysis period.

The large-scale vector indexing system is an intelligent retrieval infrastructure for unstructured high-dimensional data (such as text, images, audio, video, etc.), which can represent complex data through feature vectorization and build an efficient indexing structure to achieve fast similarity search and nearest neighbor query. The system usually has a distributed architecture, strong scalability, and supports approximate or exact retrieval. It is widely used in big data intensive scenarios such as artificial intelligence, recommendation systems, natural language processing, and computer vision. It is a key technical support platform for semantic understanding and intelligent matching.
