According to our (Global Info Research) latest study, the global Laser 3D Camera market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Laser 3D camera is a type of 3D scanner that uses a laser beam to project a line or a pattern onto an object and then captures the reflected light with a camera. By measuring the distortion or displacement of the laser line or pattern, the camera can calculate the depth or distance of each point on the object's surface and create a 3D point cloud of the object. This process is also known as 3D triangulation.
