Abstracts

The global Laser Direct Imaging (LDI) Lens market size is expected to reach \$ 305 million by 2032, rising at a market growth of 9.6% CAGR during the forecast period (2026-2032).

A Laser Direct Imaging (LDI) Lens is a high-precision optical imaging lens or projection objective used in laser direct imaging and maskless lithography systems. It projects or focuses digitally controlled laser patterns onto a photoresist-coated substrate, enabling accurate exposure, fine pattern transfer and high-resolution image formation without a physical photomask.

The upstream materials mainly include UV-grade fused silica, optical glass, high-homogeneity glass blanks, quartz or crystal optical materials, optical coating materials, precision metal lens barrels, spacers, mounts, adhesives and cleanroom-grade mechanical parts. The more critical material requirements are high UV or violet-light transmission, low absorption, low fluorescence, high laser damage threshold, stable refractive index and good thermal stability. Downstream customers are mainly LDI equipment manufacturers, PCB exposure equipment companies, IC substrate and advanced packaging equipment suppliers, semiconductor direct-write lithography equipment suppliers and precision optical system integrators. End-use industries include high-end PCB manufacturing, solder mask exposure, IC substrates, advanced packaging, semiconductor lithography, thin-film devices and related microelectronic manufacturing.

In 2025, global sales of Laser Direct Imaging (LDI) Lens reached approximately 4,467 units, with an average global market price of around US\$ 35 K/unit. Production capacity varies significantly among manufacturers, with gross profit margins ranging from

approximately 40% to 70%.
