## Abstracts

The global Laser Divergence Angle Detector market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The laser divergence angle detector is an instrument used to measure the divergence angle of the laser beam emitted by the laser. Laser divergence angle refers to the degree of spread of the laser beam after it is emitted from the laser, usually expressed as an angle. The laser divergence angle detector calculates the divergence angle of the laser beam by measuring the cross-sectional size of the laser beam at different distances. Laser divergence angle detectors usually use optical components and detectors to achieve measurements. Optical elements can be lenses, gratings or mirrors, etc., used to focus or separate the laser beam. The detector can be a photodiode, photoresistor or photodetector, etc., used to measure the light intensity of the laser beam at different positions. Laser divergence angle detector can be used in the manufacturing and quality control process of lasers. By measuring the divergence angle of the laser beam emitted by the laser, the performance and stability of the laser can be evaluated. At the same time, the laser divergence angle detector can also be used for laser adjustment and optimization to achieve the required laser beam quality and characteristics.
