Abstracts

The global Laser Doping Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Laser Doping Machine is a technology that greatly reduces the cost of the process and increases the energy conversion efficiency. Heavy doping is carried out on the contact part of the metal grid line (electrode) and the silicon wafer, while light doping (low concentration doping) is kept outside the electrode. This structure reduces the recombination of minority carriers on the surface of the emitter, while the metal electrode and the emitter Good ohmic contact can be formed between them, so as to obtain higher short-circuit current, open-circuit voltage and fill factor, and improve the conversion efficiency of solar cells.

This report studies the global Laser Doping Machine production, demand, key manufacturers, and key regions.
