According to our (Global Info Research) latest study, the global Laser Doppler Vibrometry market size was valued at USD 24 million in 2022 and is forecast to a readjusted size of USD 28 million by 2029 with a CAGR of 2.7% during review period.

A laser Doppler vibrometer (LDV) is a scientific instrument that is used to make non-contact vibration measurements of a surface. The laser beam from the LDV is directed at the surface of interest, and the vibration amplitude and frequency are extracted from the Doppler shift of the reflected laser beam frequency due to the motion of the surface. The output of an LDV is generally a continuous analog voltage that is directly proportional to the target velocity component along the direction of the laser beam.
