According to our (Global Info Research) latest study, the global Laser Fusion Neutron Source market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A laser fusion neutron source is a device or process that produces neutrons through a laser fusion reaction. Specifically, it uses a high-energy laser beam to trigger a fusion reaction (usually fusion between light atomic nuclei), releasing neutrons during the fusion process. A laser fusion neutron source uses a high-intensity laser beam as an energy source, which is focused and irradiated onto a fusion material (such as a target material composed of light atomic nuclei such as deuterium and tritium). Under the irradiation of the laser, the fusion material is heated and compressed to extremely high temperatures and densities, thereby triggering a fusion reaction. During the fusion reaction, light atomic nuclei fuse into heavy atomic nuclei, while releasing a large amount of energy and neutrons. The neutrons produced by the fusion reaction have high energy and speed and can be used in various scientific research and applications.
