The global Laser Hair Removal Devices for Medical Aesthetics market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Laser hair removal is based on the principle of selective photothermodynamics. By adjusting the laser wavelength reasonably, the beam will penetrate the surface of the skin and be absorbed by the hair follicles. Through the selective absorption of laser energy, the hair follicles will be damaged, and the hair will lose its ability to regenerate. without damaging surrounding tissues. The anagen phase is the early stage of hair growth, the activity is strong, and there is abundant melanin in the hair follicles, so the laser mainly destroys the hair follicles in the anagen phase.
