According to our (Global Info Research) latest study, the global Laser Non-polarizing Cubic Beamsplitter market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Laser non-polarizing cubic beamsplitter is an optical component usually composed of two glass prisms. It can divide the incident light into two beams of equal intensity, one is the reflected beam and the other is the transmitted beam. Unlike polarizing beamsplitters, laser non-polarizing cubic beamsplitters do not cause the polarization effect of light, that is, they do not change the polarization state of the beam. Laser non-polarizing cube beamsplitters usually consist of two glass prisms with specific optical coatings. These optical coatings make the intensity of reflected light and transmitted light equal by reflecting and transmitting light beams on the glass surface without changing the polarization state of the light beam. Therefore, regardless of the polarization state of the incident light, the laser non-polarizing cubic beam splitter is able to evenly split the beam into two beams of equal intensity.
