## Abstracts

Power and energy meters measure the output of an optical source. They are a necessity in a wide variety of applications in the lab, on the production floor, or in the field, whether the emission is from low-light sources, such as fluorescence, or from high-energy pulsed lasers.

Although power meters and energy meters are available separately, they have also converged as single category instruments—power-and-energy-meters or PEMs—with the development of versatile consoles or displays that can adapt to a variety of different types of optical sensors. The type of sensor determines whether the device measures optical power or energy, typically in watts or joules, respectively. By itself, a power meter measures either continuous wave (CW) or repetitively pulsed sources, and the typical sensors would be either thermopile or photodiode. An energy meter typically measures pulsed lasers, either single or repetitive pulses, and sensors would include pyroelectric, thermopile, or photodiode with circuitry specially designed to measure pulses. Laser power and energy meters play a vital role in quality control, safety compliance, and performance optimization within the laser industry.

According to our (Global Info Research) latest study, the global Laser Power and Energy Meters market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
