Abstracts

According to our (Global Info Research) latest study, the global Laser Pumping market size was valued at US\$ 331 million in 2024 and is forecast to a readjusted size of USD 543 million by 2031 with a CAGR of 6.3% during review period.

Laser pumping is the process of providing energy to a laser medium (the material that amplifies light) to excite its atoms or molecules, raising them from a lower-energy state to a higher-energy state. This energy input is essential to achieve the population inversion required for laser action, where more atoms or molecules are in an excited state than in the ground state. This inversion allows for the amplification of light and the generation of coherent laser output.
