Abstracts

According to our (Global Info Research) latest study, the global Laser Tab Notching Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The tabs are metal conductors inside the lithium battery that lead out the positive and negative current collectors. Tab forming is a process of cutting conductors on the positive and negative current collectors. It is generally used as a pre-process of winding or lamination. It is one of the key processes in the manufacturing process of power batteries and some consumer electronic batteries.

Traditionally, tab forming has mainly used mechanical die-cutting processes. The mechanical die-cutting process has limitations such as fast mold loss, long mold change time, poor flexibility, and low production efficiency. It is increasingly unable to meet the development requirements of lithium battery manufacturing. Due to the many advantages of laser cutting technology and the maturity of high-power, high-beam-quality nanosecond lasers and single-mode continuous fiber technology, laser tab cutting has gradually become the mainstream of tab forming technology.

The Global Info Research report includes an overview of the development of the Laser Tab Notching Machine industry chain, the market status of Power Battery (Vertical, Horizontal), Consumer Electronics Batteries (Vertical, Horizontal), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Laser Tab Notching Machine.
