Abstracts

The global Laser Tab Notching Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The tabs are metal conductors inside the lithium battery that lead out the positive and negative current collectors. Tab forming is a process of cutting conductors on the positive and negative current collectors. It is generally used as a pre-process of winding or lamination. It is one of the key processes in the manufacturing process of power batteries and some consumer electronic batteries.

Traditionally, tab forming has mainly used mechanical die-cutting processes. The mechanical die-cutting process has limitations such as fast mold loss, long mold change time, poor flexibility, and low production efficiency. It is increasingly unable to meet the development requirements of lithium battery manufacturing. Due to the many advantages of laser cutting technology and the maturity of high-power, high-beam-quality nanosecond lasers and single-mode continuous fiber technology, laser tab cutting has gradually become the mainstream of tab forming technology.

This report studies the global Laser Tab Notching Machine production, demand, key manufacturers, and key regions.
