According to our (Global Info Research) latest study, the global Latanoprost for Open-angle Glaucoma market size was valued at US\$ 1083 million in 2025 and is forecast to a readjusted size of US\$ 1315 million by 2032 with a CAGR of 2.8% during review period.

Latanoprost for open-angle glaucoma refers to latanoprost-based ophthalmic formulations, mainly 0.005% eye drops or ophthalmic emulsion, used to reduce elevated intraocular pressure in patients with open-angle glaucoma. Latanoprost is a prostaglandin F₂ analogue and is commonly used once daily, making it suitable for long-term glaucoma management. Its upstream supply chain includes prostaglandin chiral intermediates, esterification reagents, solvents, buffer salts, preservatives or preservative-free packaging systems, purified water, LDPE ophthalmic bottles and secondary packaging materials. Downstream demand mainly comes from hospital ophthalmology departments, ophthalmic clinics, retail pharmacies, online prescription refill channels and chronic glaucoma follow-up management.

In 2025, global latanoprost for open-angle glaucoma production reached approximately 350 million units, with an average global market price is \$3 per unit.

Latanoprost for open-angle glaucoma is a prostaglandin analogue used to reduce intraocular pressure in patients with open-angle glaucoma. It is mainly supplied as a 0.005% ophthalmic solution. Its mechanism is based on activation of prostaglandin FP receptors and enhancement of aqueous humor outflow, particularly through the uveoscleral pathway, thereby lowering intraocular pressure. The FDA-approved XALATAN label states that latanoprost is indicated for reducing elevated intraocular

pressure in patients with open-angle glaucoma or ocular hypertension, with the usual dosing regimen of one drop in the affected eye or eyes once daily in the evening.

Within open-angle glaucoma treatment, latanoprost is one of the foundational first-line intraocular-pressure-lowering therapies. Compared with beta blockers, carbonic anhydrase inhibitors, and alpha agonists, prostaglandin analogues generally offer once-daily dosing, proven pressure-lowering efficacy, relatively limited systemic adverse effects, and extensive long-term clinical experience. The NICE BNF treatment summary also lists topical prostaglandin analogues, including latanoprost, tafluprost, travoprost, and bimatoprost, as first-line treatment options for glaucoma and ocular hypertension. The AAO 2025 Primary Open-Angle Glaucoma Preferred Practice Pattern notes that a reasonable initial treatment goal for POAG patients is usually a 20%–30% reduction in IOP from baseline, with further adjustment according to disease course.

From a market-development perspective, Latanoprost for Open-angle Glaucoma has entered a mature generic-competition stage. Originator brands still retain clinical recognition and brand inertia, but market growth is increasingly driven by a larger patient base, population aging, improved diagnosis rates, long-term adherence management, and penetration in emerging markets. Because glaucoma treatment is typically long term and often lifelong, price, accessibility, ocular comfort, preservative-related ocular-surface irritation, packaging convenience, and patient adherence are becoming important competitive factors.
