Abstracts

Spinal fusion is a neurosurgical or orthopedic surgical technique that joins two or more vertebrae. This procedure can be performed at any level in the spine (cervical, thoracic, or lumbar) and prevents any movement between the fused vertebrae. There are many types of spinal fusion and each technique involves using bone grafting- either from the patient (autograft), donor (allograft), or artificial bone substitutes - to help the bones heal together. Additional hardware (screws, plates, or cages) is often used to hold the bones in place while the graft fuses the two vertebrae together. Lateral Lumbar Interbody Fusion is one type of spinal fusion, that entire intervertebral disc between vertebrae is removed and bone graft is placed in the space between the vertebra. A plastic or titanium device may be placed between the vertebra to maintain spine alignment and disc height.

Scope of the Report:

This report studies the Lateral Lumbar Interbody Fusion market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Lateral Lumbar Interbody Fusion market by product type and applications/end industries.
