According to our (Global Info Research) latest study, the global Latex Particle-Enhanced Turbidimetric Immunoassay (PETIA) market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The latex particle-enhanced immunoturbidimetric immunoassay (PETIA) is a particle-enhanced turbidimetric immunoassay technology that utilizes the particle enhancement effect and combines immunological principles to quantitatively determine the concentration of specific proteins in body fluids. In PETIA, the substance to be detected binds to a specific antibody to form an immune complex, and then latex particles (usually polystyrene particles) with affinity are added, which bind to the immune complex and form clumps. When immune complexes bind to latex particles, a turbid solution results. Next, an optical instrument is used to measure the turbidity of the solution, which is proportional to the concentration of the substance to be measured.

The PETIA technology has the advantages of high sensitivity, easy operation, and high degree of automation. It can be used to measure proteins, hormones, tumor markers in serum, which is of great significance.
