The global LCD Polarizer market size is expected to reach \$ 13380 million by 2029, rising at a market growth of 3.5% CAGR during the forecast period (2023-2029).

LCD polarizer is the core component of LCD. With the gradual transfer of downstream panel production capacity to inland China, the international transfer path of the polarizer industry: Japan-Korea-Taiwan-China.

An LCD polarizer is a filter that controls light waves. It's designed to block light waves of a certain polarization while simultaneously allowing light waves of a different polarization. Polarizers work by restricting the type of light that reaches the LCD's pixel layer. The purpose of a polarizer is to create visible images. Without them, you wouldn't be able to see the images produced by an LCD. LCDs typically have two polarizers. Polarizers are typically made of a clear crystalline material. They are designed specifically to allow certain wavelengths of light while blocking others. The light produced by the LCD's lighting system must pass through the polarizers before reaching the pixel layer.
