Abstracts

The global LCD Pressing Equipment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

LCD Pressing Equipment is a type of machinery that is used to assemble and bond the glass plates of liquid crystal displays (LCDs). LCDs are thin panels of glass or plastic that are used for electronically displaying text, images, or video. LCDs consist of two glass plates with a layer of liquid crystal material sandwiched between them. The liquid crystal material can change its orientation when an electric current is applied, allowing light to pass through or be blocked by the panel. LCDs require a backlight because they do not emit light on their own.

LCD Pressing Equipment is used to dispense or print a sealant material on one glass plate, spray spacers on the other glass plate, align and press the two glass plates together, and cure the sealant material with heat and pressure. The sealant material forms a closed cell around the liquid crystal layer, preventing air and moisture from entering. The spacers maintain a uniform gap between the two glass plates, ensuring a consistent display quality. LCD Pressing Equipment can also be used for back glass replacements.
