Abstracts

According to our (Global Info Research) latest study, the global LCD Substrates market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

LCD substrate is a special glass used for thin-film transistor (TFT) LCDs which form the display area of products including LCD televisions, personal computers and mobile phones. An LCD panel consists of various components stacked in a number of layers. These components include a polarizer, a color filter and a liquid crystal layer, with the glass substrate being the most important.

One of the major drivers in this market is the use of LCDs in many devices, such as smartphones, tablets, TVs, and PCs. As CRT becomes less and less popular, LCD has become the main technology used in many devices, especially portable ones. This is due largely to the reduction in device size and size of display panels, and because the demand for high-quality display has been increasing.

The Global Info Research report includes an overview of the development of the LCD Substrates industry chain, the market status of Televisions (Gen. 8 and above, Gen. 7), Monitors (Gen. 8 and above, Gen. 7), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of LCD Substrates.

Regionally, the report analyzes the LCD Substrates markets in key regions. North America and Europe are experiencing steady growth, driven by government initiatives and increasing consumer awareness.
