According to our (Global Info Research) latest study, the global Lead-based Bearing Alloys market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Lead-based bearing alloys are also called lead-based babbitt alloys. It is a lead-antimony-tin-copper alloy, which has moderate hardness, good running-in performance, slightly larger friction coefficient, and low toughness. Mainly used for cables, batteries, etc. A bearing alloy based on lead and antimony. Its microstructure at room temperature is a soft matrix β solid solution (solid solution of antimony dissolved in lead) distributed with hard point β' phase (solid solution of lead dissolved in antimony). In order to improve strength, hardness and wear resistance, 6% to 16% tin is usually added, and 1% to 2% copper is often added to prevent specific gravity segregation. In addition, adding a small amount of arsenic and cadmium can refine the structure and improve the high-temperature hardness of the alloy.
